---

One application on our server.

— virtual machines.

# Containers

Windows:

Docker Desktop

+

WS2

Mac:

VMs

&

Docker Desktop

Linux:

As

it

is

Docker- It is tool which creates container to run our app in our machine in an isolated environment

①

Runtime

Runtime allows us to start and stop containers.

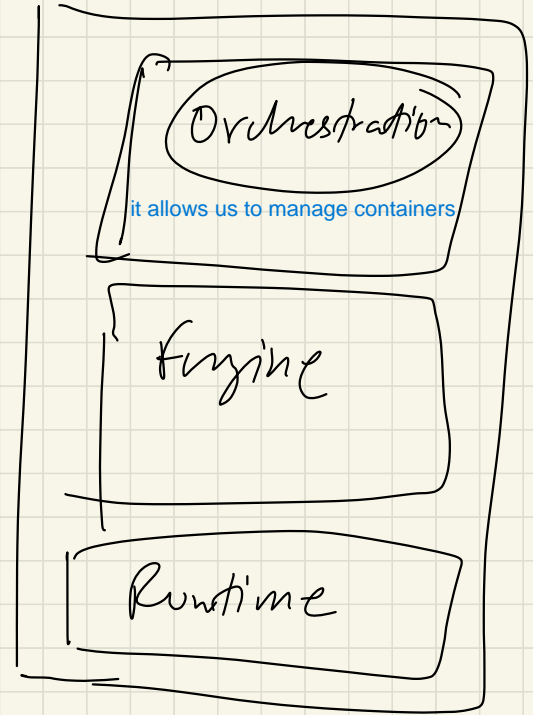

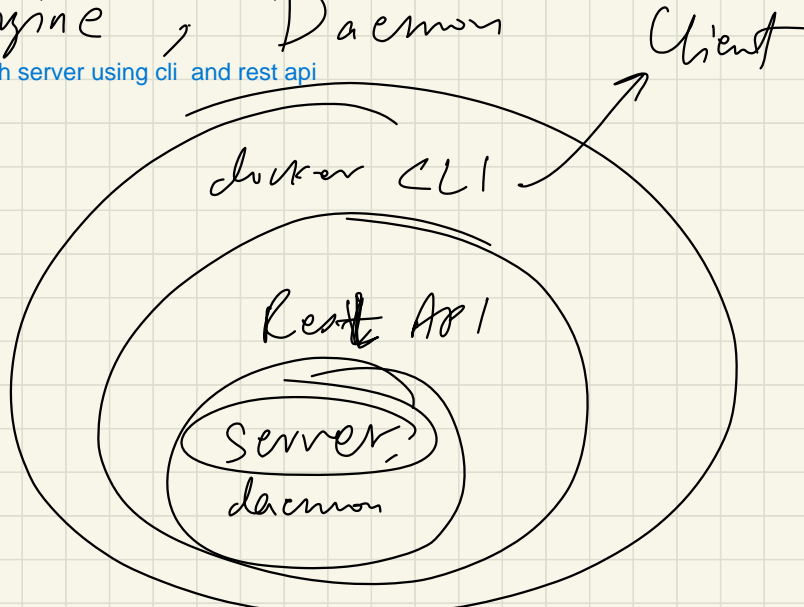

low-level runtime — *runC* (it works with our OS and starts and stop the cont)

high-level runtime — *containerd* (it manages run C, helps in manages container, also pulling the images, connecting to network and data)

②

Engine, Daemon

it used to interact with server using cli and rest api

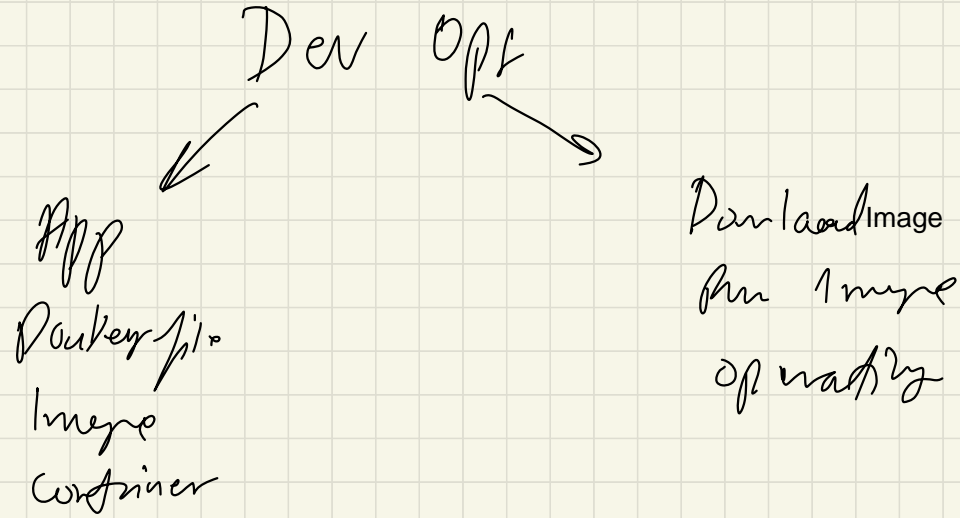

Docker Container

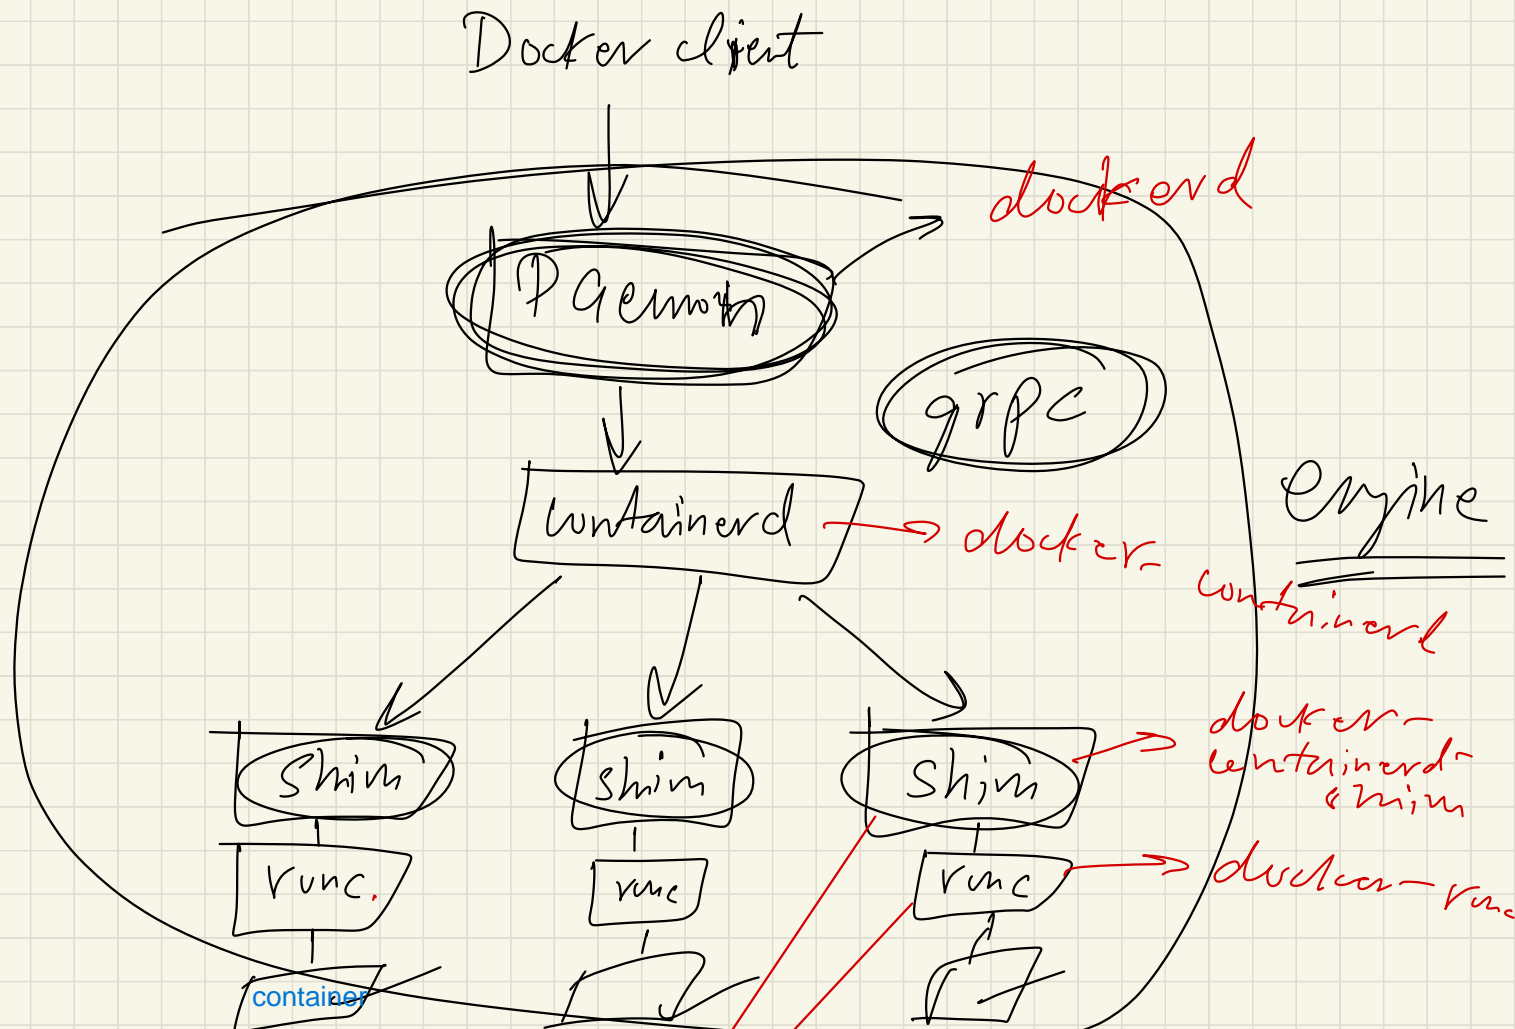

we run docker file(list of instructions to create an image), we can use the image to create our container.

\$ docker run hello-world

→ image name

Client  $\xrightarrow{\text{HTTP (2375)}}$  Server

TLS  $\rightarrow$  Transport layer security.

$\rightarrow$  later on.
